PowerShell Module Overview

Gladinet PowerShell module is one of the ways to consume the Gladinet Cloud Enterprise User Management API. It packages the various APIs in to a PowerShell module, making it easy to call the APIs via PowerShell scripts.

You can get the PowerShell module from Gladinet Support (support@gladinet.com)

Loading the PowerShell Module

You will do Import-Module GCEAutomation.dll to load the PowerShell module

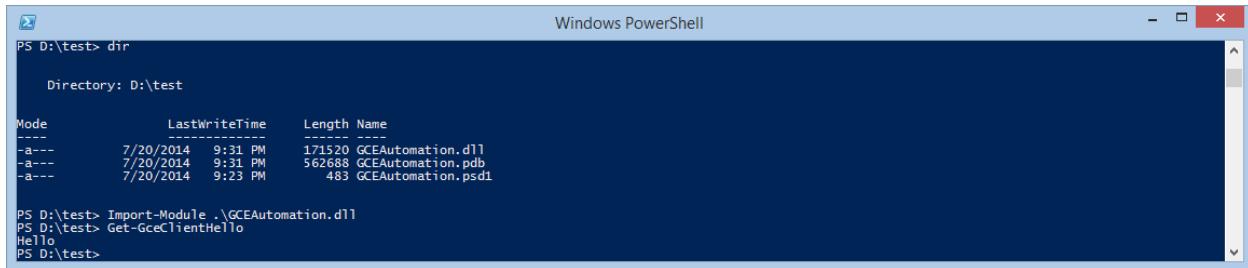

A screenshot of a Windows PowerShell window titled "Windows PowerShell". The command PS D:\p4\gcloud1_0\PowerShell\GCEAutomation\bin\Debug> copy *. = d:\test is run, followed by PS D:\p4\gcloud1_0\PowerShell\GCEAutomation\bin\Debug> cd D:\test. Then, PS D:\> dir is run, showing a directory listing:

Mode	LastWriteTime	Length	Name
-a---	7/20/2014 9:31 PM	171520	GCEAutomation.dll
-a---	7/20/2014 9:31 PM	562688	GCEAutomation.pdb
-a---	7/20/2014 9:23 PM	483	GCEAutomation.ps1

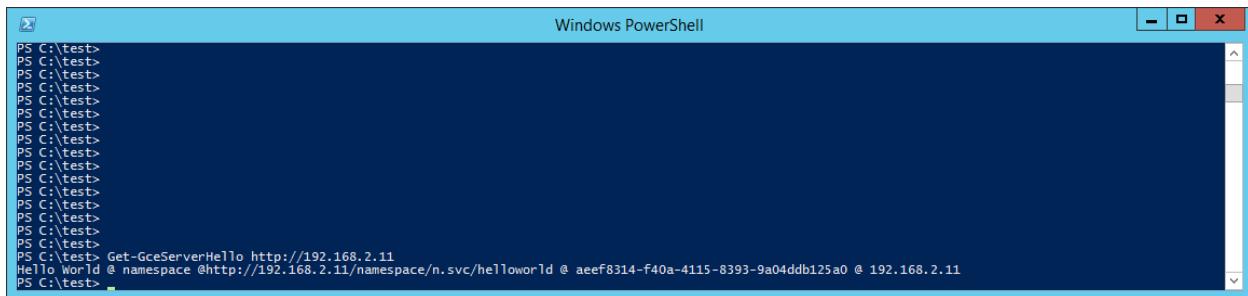

Finally, PS D:\> Import-Module .\GCEAutomation.dll is run.

To test that the PowerShell module has been successfully loaded, you can issue command Get-GceClientHello. Once you get the Hello back, the module is confirmed loaded.

A screenshot of a Windows PowerShell window titled "Windows PowerShell". The command PS D:\> dir is run, followed by PS D:\> Import-Module .\GCEAutomation.dll. Then, PS D:\> Get-GceClientHello is run, resulting in the output "Hello". Finally, PS D:\> is shown.

To test that the PowerShell module can talk to a remote Gladinet Cloud Enterprise server, you can issue command Get-GceServerHello. When you get the server information back, the server is reachable and it is OK to issue PowerShell commands to it.

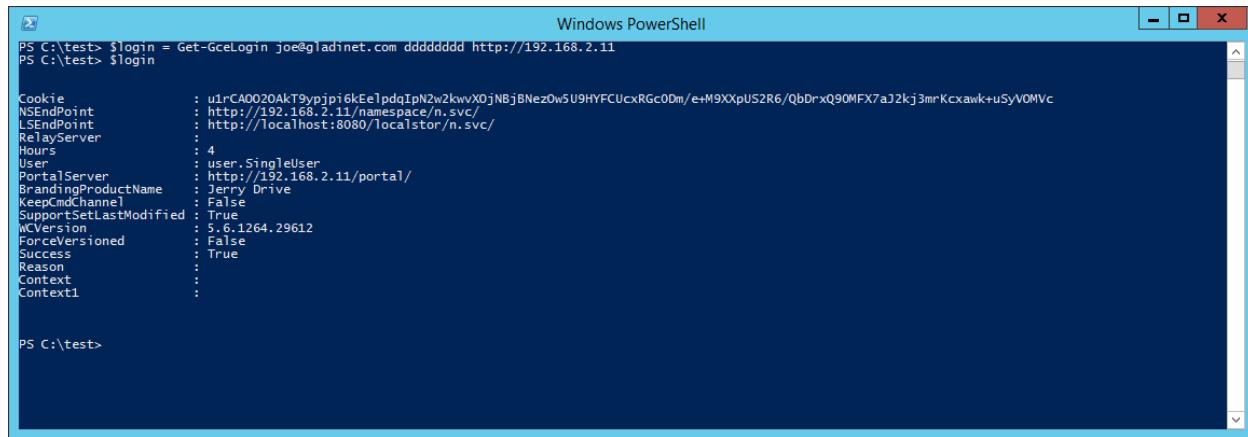

A screenshot of a Windows PowerShell window titled "Windows PowerShell". The command PS C:\> is run multiple times, followed by PS C:\> Get-GceServerHello http://192.168.2.11. The output shows the server information: "Hello World @ namespace @http://192.168.2.11/namespace/n.svc/helloworld @ aeef8314-f40a-4115-8393-9a04ddb125a0 @ 192.168.2.11". Finally, PS C:\> is shown.

Get-GceLogin

It takes 3 parameters.

1. First parameter is the username,
2. Second parameter is the password
3. Third parameter is the Server Url.

When the login returns, you can inspect the result. When the Success field is True, you can save away the result and the Cookie field will be used later.

```
Windows PowerShell
PS C:\test> $login = Get-GceLogin joe@gladinet.com dddddd http://192.168.2.11
PS C:\test> $login

```

Synopsis

Login to the system and get back security token.

Syntax

```
Get-GceLogin [-UserName] <String> [-Password] <String> [ [-ServerUrl]
<String>] [<CommonParameters>]
```

Description

Most of the other functions in the PowerShell CmdLet require a security token from the user. This function login to the system and returns the user's security token.

Parameters

-UserName <String>

Tenant user name for login. Most of the time it is email address.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-Password <*String*>

Tenant user password

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <*String*>

Remote server URL. Such as "http://192.168.0.1"

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

LoginResult

The result contains user cookie which can be used for other functions later.

Notes

Get-GceTenants

Gets a list of tenants in the system.

It takes two parameters.

1. First Parameter is the LoginToken.
2. Second Parameter is the ServerUrl

When it is successful, the Success field is True. The Tenants field is a list of Tenants.

A screenshot of a Windows PowerShell window titled "Windows PowerShell". The window shows the output of the Get-GceTenants cmdlet. The output includes various properties and their values, such as LSEndPoint, RelayServer, Hours, User, PortalServer, BrandingProductName, KeepCmdChannel1, SupportSetLastModified, mCVersion, ForceVersioned, Success, Reason, Context, and Context1. The Success property is set to True. The Tenants property is listed as a collection containing "Joe", "tenant", "tenant", and "tenant...". The command PS C:\test> \$tenants = Get-GceTenants \$login.Cookie http://192.168.2.11 is shown at the bottom of the window.

```
PS C:\test> $tenants = Get-GceTenants $login.Cookie http://192.168.2.11
PS C:\test> $tenants

Tenants : {Joe, tenant, tenant, tenant...}
Success : True
Reason  :
Context  :
Context1 :
```

You can further inspect the tenants by looking into the Tenants field.

```

PS C:\test> $tenants.Tenants | Out-GridView
PS C:\test>

```

When you get the Tenants back, pay special attention to the DomainId field:

DomainId : 4248e07f-600a-429c-bfc2-d6cf7a2ab4e2

This will be the TenantID for each tenant and it is different from tenant to tenant.

Synopsis

Gets a list of all tenants in the system.

Syntax

```
Get-GceTenants [-LoginToken] <String> [[-ServerUrl] <String>]  
[<CommonParameters>]
```

Description

Gets a list of all tenants in the system. The caller shall be the master admin who has enough privilege to query the list of tenants.

Parameters

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	1

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

EnumTenantsResult

When it is successful, the Success field is true. The tenants field contains a list of all tenants in system.

Notes

The caller's security token will need to have privilege to list tenants.

Examples

Example 1

```
PS C:\> PS D:\> $tenants = Get-GceTenants $login.Cookie http://localhost
```

```
PS D:\> $tenants
```

Synopsis

Return a list of users for a specific tenant.

Syntax

```
Get-GceTenantUsers [-TenantGuid] <String> [-LoginToken] <String> [ [-ServerUrl] <String>] [<CommonParameters>]
```

Description

Return a list of all users for a specific tenant. The tenant is specified as the GUID for the tenant. The GUID is the DomainId field for each tenant when you do a Get-GceTenants

Parameters

-TenantGuid <String>

Tenant GUID (DomainId)

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

EnumUserResult

When it is successful, the Success field is true. The UserList field contains a list of all users in the tenant.

Notes

Expire        : 07/07/2016 09:00:00 PM
ResellerName  :
```

We can also sent the list to a GridView

The screenshot shows a PowerShell session on the left and a Windows application window on the right. The PowerShell session displays tenant information with some fields redacted. The application window is titled '\$tenant.Tenants | Out-GridView' and shows a grid view of the same data, with the first row being a header.

DomainId	AdminId	ResellerId	FirstName	LastName	Email	IsActivated	IsDeleted
5863df25-bad9-489d-bfaa-475707c09b15	47801cf2-ab78-44a1-9add-649c5ef5b33e		Mike	Lee	joe@gladinet.com	True	False

Synopsis

Return tenant information based on TenantID.

Syntax

```
Get-GceTenantInfo [-TenantGuid] <String> [-LoginToken] <String> [[-  
ServerUrl] <String>] [<CommonParameters>]
```

Description

Return tenant information based on given TenantID. Each tenant is represented by a unique identifier in the GUID format (DomainId).

Parameters

-TenantGuid <String>

Tenant GUID.

Required?	True
-----------	------

Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

User's security token for the caller of the function.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

EnumTenantResults

The field Tenants contains a list with a single entry. The Single Entry is the tenant returned. Before checking the tenant information, make sure the success property is true.

Notes

Get-GceUserInfo

This function will return a specific user information by User ID.

It takes 3 parameters.

1. First Parameter is UserGuid (This is the Unique Id for the user)
2. Second Parameter is LoginToken (This is the Login Token represent the user making the call)
3. Third Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> $user = Get-GceUserInfo $userid $cookie $url
PS C:\test> $user

FirstName : Mike
LastName  : Lee
Email     : joe@gladinet.com
Success   : True
Reason    :
Context   :
Context1  :

PS C:\test>
```

When it is successful, the Success field is True. If it is success it will return user's first name, last name and email.

Synopsis

Return a specific user's information by User's GUID.

Syntax

```
Get-GceUserInfo [-UserGuid] <String> [-LoginToken] <String> [[-  
ServerUrl] <String>] [<CommonParameters>]
```

Description

This function returns user's information by User's GUID. The user's GUID is the UserGuid field for each user when it is returned from the Get-GceTenantUsers.

Parameters

-UserGuid <String>

User GUID

Required?	True
-----------	------

Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

QueryUserResult

When it is successful, the Success field is true. The result also return FirstName, LastName and Email. Basically this is a UserGuid to User name and email look up.

Notes

Examples

Example 1

```
PS C:\> PS D:\> $user = Get-GceUserInfo "df2383d0-ee8f-4cf4-8575-ab7330bd73b1" $login.Cookie http://localhost

When it is successful, the Success field is True.

Synopsis

This function will update user firstname and lastname based on UserGuid.

Syntax

```
Set-GceUserName [-UserGuid] <String> [-FirstName] <String> [-LastName]
<String> [-LoginToken] <String> [[-ServerUrl] <String>]
[<CommonParameters>]
```

Description

This function will update user firstname and lastname based on UserGuid. You can get the UserGuid by Get-GceUserInfoByEmail.

Parameters

-UserGuid <String>

User GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-FirstName <String>

User first name.

Required?	True
Position?	1

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LastName <String>

User last name.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	4
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

Success Reason Context Context1  
----- -----  
True  
  
PS C:\test>
```

When it is successful, the Success field is true.

Synopsis

This function will update storage quota for a special tenant.

Syntax

```
Set-GceTenantStoragePlan [-TenantGuid] <String> [-StoragePlanInGB]
<Int32> [-LoginToken] <String> [[-ServerUrl] <String>]
[<CommonParameters>]
```

Description

This function will update storage quota for a special tenant. The tenant is represented by the Tenant ID (DomainId)

Parameters

-TenantGuid <String>

Tenant GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-StoragePlanInGB <Int32>

Size of storage space.

Required?	True
Position?	1

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

Notes

Examples

Example 1

```
PS C:\> PS D:\> $result = Set-GceTenantStoragePlan "d57eac12-8485-4a59-b74c-dea6d037ba83" 200 $login.Cookie http://localhost  
PS D:\> $result
```

Set-GceTenantAdminEmail

This function will update the admin user's email address for a specific tenant.

It takes 4 parameters.

1. First Parameter is TenantGuid (This is the DomainId for the Tenant)
2. Second Parameter is AdminEmail (This is tenant email address)
3. Third Parameter is LoginToken (This is the Login Token represent the user making the call)
4. Fourth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> Set-GceTenantAdminEmail $tenantID "joe@gladinet.com" $cookie $url
Success Reason          Context          Context1
----- -----          -----
True

PS C:\test>
```

When it is successful, the Success field is true.

Synopsis

Update email address for a specific tenant administrator

Syntax

```
Set-GceTenantAdminEmail [-TenantGuid] <String> [-AdminEmail] <String> [-  
LoginToken] <String> [ [-ServerUrl] <String>] [<CommonParameters>]
```

Description

Update email address for a specific tenant administrator. When success, the tenant administrator's email address will be changed to the new email address.

Parameters

-TenantGuid <String>

Tenant GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-AdminEmail <String>

The new email address for the tenant. When success, the tenant administrator's email address will be changed to the new email address.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	3

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

Notes

New-GceUser

This function will create a new user under a specific tenant.

It takes 12 parameters.

1. First Parameter is TenantGuid (This is the DomainId for the Tenant)
2. Second Parameter is FirstName (This is the user's firstname)
3. Third Parameter is LastName (This is the user's lastname)
4. Fourth Parameter is Email (This is the user's email)
5. Fifth Parameter is Password (This is the user's Password)
6. Sixth Parameter is StorageQuotaInGB (This is the size of Storage Quota)
7. Seventh Parameter is CreateDefaultDirectory (Boolean, This is the flag to identify if create default folder structure)
8. Eighth Parameter is ForceVersionedRootFolder (Boolean, This is the flag to identify if force use version for folder name)
9. Ninth Parameter is EnableOfflineFromRoot (Boolean, whether to enable Windows client to make the folder offline starting from the root folder)
10. Tenth Parameter is SendWelcomeEmail (Boolean, Identify if send out welcome email)
11. Eleventh Parameter is LoginToken (This is the Login Token represent the user making the call)
12. Twelfth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> $user = New-GceUser $tenantID "Jeffry" "Hunk" "Jeffery@gladinet.com" "dd" 5 1 1 1 0 $cookie $url
PS C:\test> $user

LapseSeconds : 0
Success    : True
Reason     :
Context    :
Context1   :

PS C:\test> |
```

When it is successful, the Success field is true. It also returns the new user's GUID.

Synopsis

Create a new user under a specific tenant.

Syntax

```
New-GceUser [-TenantGuid] <String> [-FirstName] <String> [-LastName]
<String> [-Email] <String> [-Password] <String> [-StorageQuotaInGB]
<Int64> [-CreateDefaultDirectory] <Boolean> [-ForceVersionedRootFolder]
<Boolean> [-EnableOfflineFromRoot] <Boolean> [-SendWelcomeEmail]
<Boolean> [-LoginToken] <String> [[-ServerUrl] <String>]
[<CommonParameters>]
```

Description

Create a new user. The new user will be under the specified tenant (one of the input parameter). The user is a normal Gladinet user, not an imported Active Directory user. If you want to import active directory user, please use Add-GceAdUserByUPNEx instead.

Parameters

-TenantGuid <String>

Tenant Guid, the new user will be under this tenant.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-FirstName <String>

User's first name.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LastName <String>

User's last name.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-Email <String>

User's email address.

Required?	True
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-Password <String>

User's password.

Required?	True
Position?	4
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-StorageQuotaInGB <Int64>

The storage quota (in GB) for the new user.

Required?	True
Position?	5
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-CreateDefaultDirectory <Boolean>

If it is true , system will create default folder structure.

Required?	True
Position?	6
Default value	

Accept pipeline input?	false
Accept wildcard characters?	False

-ForceVersionedRootFolder <Boolean>

This is the flag to identify if every files will be versioned.

Required?	True
Position?	7
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-EnableOfflineFromRoot <Boolean>

This flag identifies whether to allow user to fetch all the files for offline access from the root folder.

Required?	True
Position?	8
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-SendWelcomeEmail <Boolean>

If set to true, system will send out a welcome email to user's email address.

Required?	True
-----------	------

Position?	9
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	10
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	11
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

GuidResult

When it is successful, the Success field is true. The GUID field contains new User GUID (UserGuid).

Reset-GceUserPassword

This function will reset the user's password based on email address.

It takes 4 parameters.

1. First Parameter is UserEmail (This is user's email address)
2. Second Parameter is Password (This is the new password)
3. Third Parameter is LoginToken (This is the Login Token represent the user making the call)
4. Fourth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> Reset-GceUserPassword "jeffery@gladinet.com" "dddd" $cookie $url
Success Reason           Context           Context1
----- -----           -----
True
```

When it is successful, the Success field is true.

Synopsis

Reset a specific user's password

Syntax

```
Reset-GceUserPassword [-UserEmail] <String> [-Password] <String> [-
LoginToken] <String> [[-ServerUrl] <String>] [<CommonParameters>]
```

Description

Reset a specific user's password. The input will be the user's email and the new password to be used.

Parameters

-UserEmail <String>

User email address

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-Password <String>

User's new password

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

```

When it is successful, the Success field is true.

Synopsis

Remove an existing user.

Syntax

```
Remove-GceUser [-UserGuid] <String> [-PurgeStorage] <Boolean> [-  
LoginToken] <String> [ [-ServerUrl] <String>] [<CommonParameters>]
```

Description

Remove an existing user.

Parameters

-UserGuid <String>

User GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-PurgeStorage <Boolean>

If it is set to true it will schedule deletion of user's data.

Required?	True
Position?	1
Default value	

Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	3

True      .               .                 .
```

When it is successful, the Success field is true.

Set-GceTenantStorageConfig

This function will set the storage configuration for a specific tenant.

It takes 4 parameters.

1. First Parameter is TenantGuid (This is the DomainId for the Tenant)

2. Second Parameter is StorageConfig (This is base64 encoded string for storage configuration, you can get back the configuration string by the helper function such as Get-GceLocalStorageConfig)
3. Third Parameter is LoginToken (This is the Login Token represent the user making the call)
4. Fourth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> $localConfig = Get-GceLocalStorageConfig "c:\storage" "test" "test" 1 0
PS C:\test> $localConfig
PS C:\test> Set-GceTenantStorageConfig $tenant.Guid $localConfig $cookie $url
Success Reason          Context          Context1
----- -----          -----
True

PS C:\test> |
```

When it is successful, the Success field is true.

New-GceTenant

This function will create a new tenant. You will need to get the storage configuration string ready first, which can be generated by helper functions such as Get-GceLocalStorageConfig , Get-GceAmazonSotrageConfig or Get-GceOpenStackStorageConfig.

It takes 11 parameters.

1. First Parameter is OrgName (This is the Organization name)
2. Second Parameter is FirstName (This is tenant firstname)
3. Third Parameter is LastName (This is tenant lastname)
4. Fourth Parameter is AdminEmail (This is tenant email address)
5. Fifth Parameter is AdminPassword (This is tenant password)
6. Sixth Parameter is UserPlan (This is tenant user plan)
7. Seventh Parameter is StoragePlan (This is size of storage plan)
8. Eighth Parameter is ExpirationTime (This is tenant expiration time)

9. Ninth Parameter is StorageConfigure (This is base64 encoded storage configuration string)
10. Tenth Parameter is LoginToken (This is the Login Token represent the user making the call)

Synopsis

Create new tenant

Syntax

```
New-GceTenant [[-OrgName] <String>] [-FirstName] <String> [-LastName]
<String> [-AdminEmail] <String> [-AdminPassword] <String> [-UserPlan]
<Int32> [-StoragePlan] <Int32> [-ExpirationTime] <String> [-
StorageConfigure] <String> [-LoginToken] <String> [[-ServerUrl]
<String>] [<CommonParameters>]
```

Description

This function will create a new tenant. You can specify the initial configuration parameters for the new tenant.

Parameters

-OrgName <String>

Organization name.

Required?	False
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-FirstName <String>

Tenant administrator's first name.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LastName <String>

Tenant administrator's last name.

Required?	True
Position?	2

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-AdminEmail <String>

Email address of tenant administrator. It will be used for login username.

Required?	True
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-AdminPassword <String>

Password of tenant administrator

Required?	True
Position?	4
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-UserPlan <Int32>

Number of users the tenant can have.

Required?	True
Position?	5
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-StoragePlan <Int32>

The Storage Quota (in GB) to be allocated to the tenant

Required?	True
Position?	6
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ExpirationTime <String>

Expiration Time. The format is "MM/DD/YYYY HH:mm:SS". It can also be a normal .NET datetime format such as

```
PS D:\> [System.DateTime]::Now
```

Thursday, July 31, 2014 12:30:55 PM

```
PS D:\> [System.DateTime]::.MaxValue
```

Friday, December 31, 9999 11:59:59 PM

Required?	True
Position?	7
Default value	
Accept pipeline input?	false
Accept wildcard characters?	True

-StorageConfigure <String>

A base64 encoded string that contains storage configuration.

Required?	True
Position?	8
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	9
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	10
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

GuidResult

When it is successful, the Success field is true. The GUID field contains new tenant ID (DomainId).

Notes

When setting the tenant's storage configuration, need to make sure the folder, or container or bucket exist before the call.

Add-GceAdUserByUPN

This function will import an AD user under a specific tenant by UPN (User-Principal-Name).

It takes 5 parameters.

1. First Parameter is UserUPN (This is AD UPN for a special user)

2. Second Parameter is StoragePlan (This is the size of storage plan)
3. Third Parameter is StorageConfigure (This is base64 encoded storage configuration string)
4. Fourth Parameter is LoginToken (This is the Login Token represent the user making the call)
5. Fifth Parameter is ServerUrl (This is the GCE server)

Add-GceAdUserByUPNEx

This function will import an AD user under a specific tenant by UPN.

It takes 7 parameters.

1. First Parameter is UserUPN (This is AD UPN for a special user)
2. Second Parameter is StoragePlan (This is the size of storage plan)
3. Third Parameter is ForceVersioned (Force version folder from root)
4. Fourth Parameter is EnableOffline (Enable User's folder offline from root)
5. Fifth Parameter is StorageConfigure (This is base64 encoded storage configuration string)
6. Sixth Parameter is LoginToken (This is the Login Token represent the user making the call)
7. Seventh Parameter is ServerUrl (This is the GCE server)

Synopsis

Add team user from Active Directory by UPN, with two additional flags - ForceVersioned and EnableOffline.

Syntax

```
Add-GceAdUserByUPNEx [-UserUPN] <String> [-StoragePlan] <Int32> [-ForceVersioned] <Boolean> [-EnableOffline] <Boolean> [-StorageConfigure] <String> [-LoginToken] <String> [[-ServerUrl] <String>] [<CommonParameters>]
```

Description

Add an active directory user to a tenant. The active directory user is specified by the User-Principal-Name.

This is an enhanced version of Add-GceAdUserByUPN, with two additional flags, ForceVersioned and EnableOffline.

Parameters

-UserUPN <String>

User's UPN in the Active Directory.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-StoragePlan <Int32>

Storage plan for added user, how many users can be created.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ForceVersioned <Boolean>

If set ForceVersioned to true, the structure of storage folder will be versioned.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-EnableOffline <Boolean>

Enable user offline.

Required?	True
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-StorageConfigure <String>

Storage configuration string, it is a base64 encoded string. You can use storage configuration helper function to get back the string. Such as Get-GceLocalConfiguration. If the storage configuration is empty, the imported user will be allocated a default storage location.

Required?	True
Position?	4

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	5
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	6
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

GuidResult

Return the GuidResult. GuidResult inherits from Result with an additional Guid property. If it is successful, the Guid is new user's unique identifier in a GUID format.

Notes

The tenant must have Active Directory setup and sufficient permission to access Active Directory.

Examples

Set-GceUserStoragePlanGB

This function will update the storage plan for specific user.

It takes 4 parameters.

1. First Parameter is UserID (This is user Guid)
2. Second Parameter is GBCount (This is size of storage plan)
3. Third Parameter is LoginToken (This is the Login Token represent the user making the call)
4. Fourth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> Set-GceUserStoragePlanGB $userGuid 1024 $cookie $url
Success Reason          Context          Context1
----- -----          -----          -----
True   
```

When it is successful, the Success field is true.

Synopsis

This function will update the storage plan for specific user.

Syntax

```
Set-GceUserStoragePlanGB [-UserID] <String> [-GBCount] <Int64> [-  
LoginToken] <String> [ [-ServerUrl] <String>] [<CommonParameters>]
```

Description

This function will update the storage plan for specific user. The storage plan is measured in GB

Parameters

-UserID <String>

User GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-GBCount <Int64>

Storage Quota in GB

Required?	True
Position?	1

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	3
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

Notes

Examples

Example 1

```
PS C:\> PS D:\> $result = Set-GceUserStoragePlanGB "ab2990b1-601f-407a-8ae1-515e5d9a3047" 50 $login.Cookie http://localhost  
PS D:\> $result
```

Set-GceUserStorageConfig

This function will update the storage configuration for a specific user.

It takes 4 parameters.

1. First Parameter is UserID (This is user GUID)
2. Second Parameter is StorageConfigure (This is base64 encoded storage configuration string)
3. Third Parameter is LoginToken (This is the Login Token represent the user making the call)

4. Fourth Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> $localConfig = Get-GceLocalStorageConfig "c:\storage" "test" 1 0
PS C:\test> $localConfig
PS C:\test> Set-GceUserStorageConfig $userGuid $localConfig $cookie $url
Success Reason Context Context1
----- ----- -----
True
```

When it is successful, the Success field is true.

Synopsis

This function will update the storage configuration for a specific user.

Syntax

```
Set-GceUserStorageConfig [-UserID] <String> [-StorageConfigure] <String>
[-LoginToken] <String> [[-ServerUrl] <String>] [<CommonParameters>]
```

Description

This function will update the storage configuration for a specific user. The storage configuration can be constructed by helper function such as Get-GceLocalStorageConfig. This way you can specify storage location for each individual users.

Parameters

-UserID <String>

User GUID

Required?	True
Position?	0
Default value	
Accept pipeline input?	false

Accept wildcard characters?	False
-----------------------------	-------

-StorageConfigure <*String*>

A base64 encoded string which can get from the helper function, such as Get-GceLocalStorageConfig.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <*String*>

Logged in user's cookie.

Required?	True
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <*String*>

The remote service address.

Required?	False
Position?	3

Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

Notes

Set-GceEnableDARE

This function will enable DARE (Date-At-Rest-Encryption) function for a specific tenant.

It takes 3 parameters.

1. First Parameter is Password (This is the password used to generate encryption key)
2. Second Parameter is LoginToken (This is the Login Token represent the user making the call)
3. Third Parameter is ServerUrl (This is the GCE server)

PS C:\test> Set-GceEnableDARE gg \$cookie \$url	Success	Reason	Context	Context1
	True			

When it is successful, the Success field is true.

Synopsis

Enable Data-At-Rest Encryption (DARE) for a specific tenant

Syntax

```
Set-GceEnableDARE [-Password] <String> [-LoginToken] <String> [[-  
ServerUrl] <String>] [<CommonParameters>]
```

Description

Enable Data-At-Rest Encryption (DARE) for a specific tenant.

Parameters

-Password <String>

Password used to encrypt folder. This password will be used to generate the key for AES-256.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's cookie. It is very important that the security token represent the tenant admin because the encryption will be enabled for the tenant, according to the security token.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service address.

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

Result

When it is successful, the Success field is true.

Notes

Examples

Example 1

```
PS C:\> PS D:\> $result = Set-GceEnableDARE pass123 $login1.Cookie

Set-GceDisableDARE

This function will disable DARE (Data-At-Rest-Encryption) function for a specific tenant.

It takes 2 parameters.

1. First Parameter is LoginToken (This is the Login Token represent the user making the call)
2. Second Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> Set-GceDisableDARE $cookie $url  
Success Reason Context Context1  
----- -----  
True
```

When it is successful, the Success field is true.

Synopsis

Disable Data-At-Rest Encryption for a specific tenant

Syntax

```
Set-GceDisableDARE [-LoginToken] <String> [[-ServerUrl] <String>]  
[<CommonParameters>]
```

Description

Disable Data-At-Rest Encryption for a specific tenant. The tenant is specified by the security token. So the disable DARE will apply to the caller's tenant.

Parameters

-LoginToken <String>

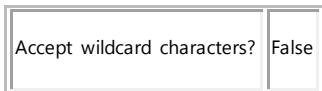

Logged in user's cookie. It is very important that the security token represent the tenant admin because the encryption will be enabled for the tenant, according to the security token.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	1
Default value	
Accept pipeline input?	false

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

UserList : []  
Success   : True  
Reason    :  
Context   :  
Context1  :
```

When it is successful, the Success field is true.

Synopsis

Get active user for specific tenant.

Syntax

```
Get-GceActiveUser [-DomainID] <String> [-LoginToken] <String> [[-  
ServerUrl] <String>] [<CommonParameters>]
```

Description

Get back the online users (web portal users) based on DomainID (TenantID). It will return a list of users for a specific tenant, when these users have a web browser open to the portal.

Parameters

-DomainID <String>

Tenant Guid

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-LoginToken <String>

Logged in user's security token, which is returned as the Cookie field from Get-GceLogin call.

Required?	True
Position?	1
Default value	
Accept pipeline input?	false

Accept wildcard characters?	False
-----------------------------	-------

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	2
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkId=113216>).

Inputs

Outputs

EnumUserResult

When it is successful, the Success field is true. Also the UserList field is a list of online users under the specific tenant.

Notes

Get-GceNodePerformance

This function will return each cluster node performance.

It takes 2 parameters.

1. First Parameter is LoginToken (This is the Login Token represent the user making the call)
2. Second Parameter is ServerUrl (This is the GCE server)

```
PS C:\test> Get-GceNodePerformance $cookie $url

RequestCount      : 0
TotalRequestCount : 0
FireChangesQueueLength : 0
PendingCompleteNodeRequests : 0
PendingNodeRequests : 0
PollStatusQueueLength : 0
RegisteredClientCount : 0
RequestTime       : 0
Success           : True
Reason            :
Context           :
Context1          :
```

When it is successful, the Success field is true.

Synopsis

Query for the server (worker node)'s performance data.

Syntax

```
Get-GceNodePerformance [-LoginToken] <String> [[-ServerUrl] <String>]
[<CommonParameters>]
```

Description

The call will return basic performance information related to a worker node (url parameter).

Parameters

-LoginToken <String>

User cookie.

Required?	True
Position?	0
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

-ServerUrl <String>

The remote service URL.

Required?	False
Position?	1
Default value	
Accept pipeline input?	false
Accept wildcard characters?	False

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<http://go.microsoft.com/fwlink/?LinkID=113216>).

Inputs

Outputs

NodePerformanceResult

It contains

TotalRequestCount, PendingCompleteNodeRequests, PollStatusQueueLength, RegisteredClientCount and RequestTime.

Notes

Examples

Example 1

```
PS C:\> PS D:\> $perf = Get-GceNodePerformance $login.Cookie  
PS D:\> $perf
```

RequestCount	:	0
TotalRequestCount	:	4
FireChangesQueueLength	:	0
PendingCompleteNodeRequests	:	0
PendingNodeRequests	:	0
PollStatusQueueLength	:	0
RegisteredClientCount	:	0
RequestTime	:	129
Success	:	True
Reason	:	
Context	:	
Context1	:

Add-GceWorkerNode

This function will add a new cluster work node to the cluster.

It takes 6 parameters.

1. First Parameter is NodeName (This is name of new node)
2. Second Parameter is ExternalUrl (This is external url of new node)
3. Third Parameter is InternalUrl (This is internal url of new node)
4. Fourth Parameter is AllowMMC (This is flag to identity allow MMC)
5. Fifth Parameter is LoginToken (This is the Login Token represent the user making the call)
6. Sixth Parameter is ServerUrl (This is the GCE server)

Get-GceLocalStorageConfig

This function will return a base64 encoded storage configuration for local storage.

It takes 5 parameters.

1. First Parameter is StorageLocation (This is the path where to save files to local)
2. Second Parameter is UserName (This is username who has permissions to access the path)
3. Third Parameter is Password (This is password for the user who has permissions to access the path)
4. Fourth Parameter is DataAtRest (This is flag to allow DARE)
5. Fifth Parameter is IsTeamUser (This is flag to identify current configuration is for tenant or for teamuser, it is not required, default is false which means tenant)

```
PS C:\test> $localConfig = Get-GceLocalStorageConfig "c:\storage" "test" "test" 1 0
PS C:\test> $localConfig

PS C:\test>
```

It will return a base64 encoded string.

Get-GceAmazonStorageConfig

This function will return a base64 encoded storage configuration for Amazon cloud storage.

It takes 5 parameters.

1. First Parameter is AccessKey (This is AccessKey of Amazon account)
2. Second Parameter is SecretKey (This is SecretKey of Amazon account)
3. Third Parameter is Bucket (This is Bucket of Amazon account)
4. Fourth Parameter is DataAtRest (This is flag to allow DARE)
5. Fifth Parameter is IsTeamUser (This is flag to identify current configuration is for tenant or for teamuser, it is not required, default is false which means tenant)

```
PS C:\test> Get-GceAmazonStorageConfig "XjeiuDfhseyAxz" "sepyneFgshsPQ" "GladinetBucket" 1 1

```

It will return a base64 encoded string.

Get-GceOpenStackStorageConfig

This function will return a base64 encoded storage configuration for OpenStack cloud storage.

It takes 6 parameters.

1. First Parameter is UserName (This is user name of OpenStack account)
2. Second Parameter is SecretKey (This is SecretKey of OpenStack account)
3. Third Parameter is Container (This is Container of OpenStack account)
4. Fourth Parameter is AccessPoint (This is access point of OpenStack account)
5. Fifth Parameter is DataAtRest (This is flag to allow DARE)
6. Sixth Parameter is IsTeamUser (This is flag to identify current configuration is for tenant or for teamuser, it is not required, default is false which means tenant)
